Shubham Vyas

Backend + Cloud Infrastructure Engineer

SUMMARY

Backend and cloud infrastructure engineer, currently **founding engineer at rifa.ai**. I build the real-time data platforms startups run on across **AWS, GCP, and Azure**, cut their cloud bills by up to **70%**, and lead them through the **SOC 2, ISO 27001, and PCI DSS** compliance that unlocks enterprise customers.

EXPERIENCE

rifa.ai — 0 → 1 · FOUNDING

Founding Engineer · Remote

Remote
Jan 2026 – Present

- Built rifa.ai's **analytics and data platform from zero to one**: real-time change-data-capture pipelines from PostgreSQL to ClickHouse powering search, filtering, and product analytics.
- Built a ClickHouse search system hitting **~380ms (p95) across 10M+ records**, replacing Elasticsearch entirely.
- Enabled **zero-downtime releases under live traffic** for the stateful, WebSocket-based voice-bot and chatbot, implementing request draining across the **GKE Dataplane V2** layer and the core application logic.
- Built **canary deployments** for the voice bot at both infrastructure and application level, and wrote a custom **Kubernetes controller** to manage the canary lifecycle of stateful applications.
- **Achieved SOC 2 Type II** and led **PCI DSS Level 1 readiness (in progress)** end to end: CDE segmentation, technical controls, and evidence collection with the QSA.
- Contributed to core product development and built a custom testing framework to ensure reliability at scale.

COMPLIANCE LED: VAPT · SOC 2 Type II · PCI DSS L1 · in progress

rdash.io

DevOps / Infrastructure Engineer · Onsite, Gurgaon

Onsite, Gurgaon
Jan 2024 – Jan 2026

- **Migrated rdash's entire infrastructure from GCP to AWS**: SQL databases, blob storage, and Kubernetes clusters.
- Cut **monitoring cost to $0** by tuning AWS Managed Prometheus, and ran logging on spot instances to cut cloud spend further.
- Built request-based and scale-to-zero autoscaling with **KEDA**, cutting non-production server costs.
- Built a **low-code automation platform** (Django + n8n) integrating rdash with external systems, letting the product team ship custom client workflows and improving lead conversion.
- Built an **ETL pipeline** (Airbyte + custom Python) from PostgreSQL to ClickHouse, feeding analytics dashboards in Metabase.
- **Led the technical track for ISO 27001, SOC 2 Type II, and VAPT**: IaC guardrails, RBAC, and remediation of penetration-test findings, partnering with the external auditor.
- Designed CI/CD and data pipelines for production and non-production using self-hosted GitHub Actions.
- Configured a self-hosted VPN with WireGuard for secure, standardized access.
- Built a Django integration connecting the rdash CRM with Facebook (Meta), streamlining social interactions.
- Used Nginx for browser-side caching, reducing latency and improving user experience.
- Deployed and maintained open-source tools (n8n, Windmill, GlitchTip, Airbyte) for development and debugging.

COMPLIANCE LED: VAPT · ISO 27001 · SOC 2 Type II

flobiz.in

DevOps Engineer · Onsite, Bangalore

Onsite, Bangalore
May 2023 – Dec 2023

- Migrated flobiz's entire infrastructure to AWS (GCP VMs, Cloud Run, GKE, Cloud Storage, MongoDB Atlas).
- Migrated the Cloud SQL database from GCP to AWS RDS, then to AWS Aurora, with minimal downtime.
- Built a CI/CD pipeline on Cloud Build and GitHub Actions for automated deployments across GKE and GCE.
- Used ArgoCD for rolling updates and rollbacks, keeping deployments continuous with minimal disruption.
- Set up GKE and GCE monitoring and logging, and self-hosted Grafana Loki to cut logging costs.
- Migrated services from GCP VMs to GKE and Cloud Run for better scalability and efficiency.
- Implemented autoscaling and Kubernetes RBAC for cost-efficient, secure, controlled multi-service operation.

makerble.com

DevOps Consultant · Remote

Remote
Aug 2022 – May 2023

- Cut cloud cost by **~70%** by eliminating idle servers, consolidating databases, and using spot instances.
- Migrated production and other environments from Heroku to AWS with **100% Terraform coverage** for automated provisioning.
- Built and maintained fully automated CI/CD pipelines (ArgoCD + Tekton) and owned AWS infrastructure (EC2, S3, RDS, Elastic Load Balancers, CloudFront, Cloudflare), including backups, patching, and scaling.
- Automated routine jobs with ArgoCD, Tekton, and Python and shell scripts.
- Deployed self-hosted SaaS tools (OpenReplay, Metabase, Grafana) for a more scalable, cost-effective stack.
- Used Docker to standardize development and testing environments across the team.
- Provided on-call support for production issues and helped developers troubleshoot and resolve them.
- Designed infrastructure and built utilization reports, presenting to eight stakeholders and two senior managers.

COMPLIANCE & SECURITY

I build the technical controls (IaC-enforced policy, least-privilege access, encryption, centralized audit logging, segmented Kubernetes) and **lead the compliance effort end to end** with the auditors. For an early-stage startup this is the work that turns audit requirements into **enterprise revenue**, and I have done it at two companies.

rdash.io

VAPT · ISO 27001 · SOC 2 Type II

Led end to end: technical controls, evidence, and auditor coordination.

rifa.ai

VAPT · SOC 2 Type II · PCI DSS L1 · in progress

Led end to end. SOC 2 Type II achieved; PCI DSS L1 in progress (CDE segmentation, QSA-led).

SKILLS

CLOUD	AWS, GCP, Azure
KUBERNETES & INFRA	Kubernetes, Terraform, Nginx, Ansible, Docker
OBSERVABILITY	Prometheus, Grafana, Loki
LINUX	NixOS, Ubuntu, Debian
DATA	PostgreSQL, ClickHouse, Redis, MongoDB, DuckDB
CI/CD & GITOPS	ArgoCD, Argo Workflows, GitHub Actions
LANGUAGES	Go, TypeScript, Python, Bash
SECURITY	VAPT, ISO 27001, SOC 2 Type II, PCI DSS

B.Tech, Information Technology · IIIT Bhopal — Software Engineering, Computer Networks, DBMS, Operating Systems, Data Structures & Algorithms
